

CONCRETE, CERAMIC AND STONE CARE

GFRC-Glass Fiber Reinforced Concrete is an extremely durable material, and with proper care, your concrete product will last a lifetime. Like natural stone products, slight variations in colour, texture and porosity may occur and are considered inherent and valued qualities of concrete.

For Cleaning:

Clean your concrete product as you would to an exotic natural stone surface such as marble or onyx. For general clean up, use warm water and soft or microfiber cloth to clean the surface.

For stubborn surface soils or stains, use a mild household cleaner or liquid soap (containing no abrasive, chlorine/bleach, or ammonium). We recommend using our **Multi surface cleaner** available for purchase in-store or on our website.

Please note: General food preparation and spills will not stain the concrete as long as the protective sealer coating is maintained. However, spills should be cleaned as soon as possible, maximum within 12 hours. Since concrete is a porous material, water 'spotting' may occur, but generally disappears after it has time to evaporate.

For Maintenance:

Exposure to long periods of rain, pollution, and sunlight and temperature extremes will accelerate the wearing of the protective sealer and cause the appearance of the concrete surface to wear. We strongly recommend resealing your top every 6 to 12 months with our **Stone/Ceramic Protector** available in-store or on our website.

WAREHOUSE

However, when the temperature is below zero degrees Celsius, if water has penetrated the concrete table/bench, you might experience issues with ice expansion which would destroy the table/bench. Resealing properly right before every winter with water-based sealant is strongly recommended to avoid cracking.

CAUTION:

- Do not drag your table. Lift from both ends and place down carefully as not to damage the edges or the leg attachments to top.
- Do not stand on the table.
- Do not to hit the table with hard objects
